

Class as an object

- Create a class as a variable into another class

Practice

- In your project name “Banking” ,
- Create a class name “Customer” with subsequent methods and the following instance variables:
 1. clientFirstName String
 2. clientLastName String
 3. dateOfBirth LocalDate
 4. address
 - ✓ Street No.
 - ✓ Street name,
 - ✓ province,
 - ✓ postal code (each of the inputs separately)
 5. phNumber String
 6. employment information (Check employed or not, if yes then display the message that “Employed”).
 7. Identification(Should ask for two pieces of IDs)

Contd.,

- In your “Account” class , declare instance variables as follows:
 1. balance
 2. accountType
 3. customer(customer class as a variable as shown in class.)
